

Materials for industrial applications

Our Activities

Development and production of construction chemicals:

- for industrial construction
- for civil construction
- for special and transport construction

Technology & Import Substitution

- In-house chemical synthesis of components
- Reliable raw material base
- Products that outperform imported counterparts

Technical Support

- Help in selecting the optimal solutions for your tasks

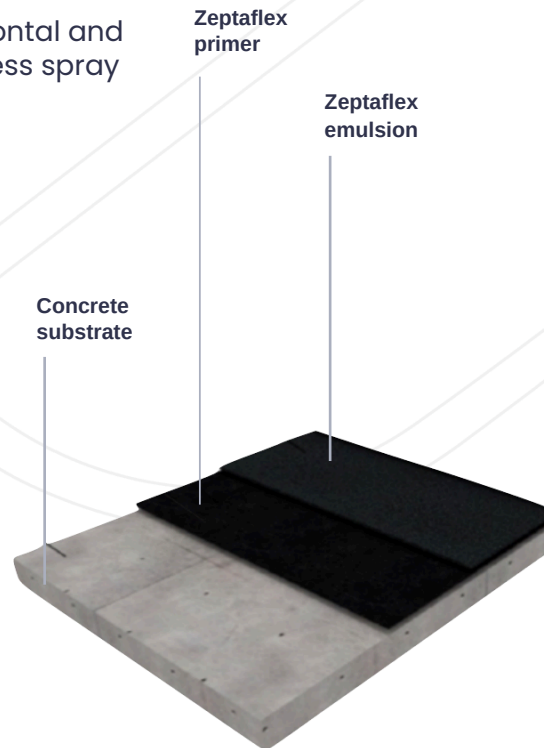

Laboratory

- Quality control from raw materials to finished products
- Modern equipment

BITUMEN-LATEX EMULSION ZEPTAFLEX®

Seamless bitumen-latex waterproofing for horizontal and vertical surfaces. Applied mechanically with airless spray equipment.

- ▶ waterproofing of foundations and other building structures buried in the ground or in contact with water
- ▶ waterproofing and anti-corrosion protection of reinforced concrete and metal tanks, swimming pools and other hydraulic structures
- ▶ waterproofing against biogenic sulfuric acid attack in sewer collector tunnels and other man-made structures
- ▶ waterproofing layer for industrial and civil pipelines
- ▶ mastic roofing and repair of all types of roofs, balconies and terraces

High environmental performance

Uniform application as a homogeneous seamless membrane

Can be applied to surfaces of any shape and configuration

A crew of 3 applies 1,200 m² of coating in one 8-hour shift

Coating remains repairable throughout its entire service life

BITUMEN-POLYMER MASTIC

ZEPTAFLEX® PASTA

A two-component mastic for seamless waterproofing of vertical and horizontal surfaces of building structures. No heating required for application.

Applications

- ▶ Waterproofing of foundations, basements, piles and other structures buried in the ground or in contact with water
- ▶ Waterproofing and protection of metal structures, including pipes and metal tanks; waterproofing of pool floors and bathrooms
- ▶ Roof installation and repair. Suitable as a repair material for all types of roofs
- ▶ Interior waterproofing of residential and industrial premises (including showers, toilets, kitchens and hallways)

High environmental performance

High chemical resistance

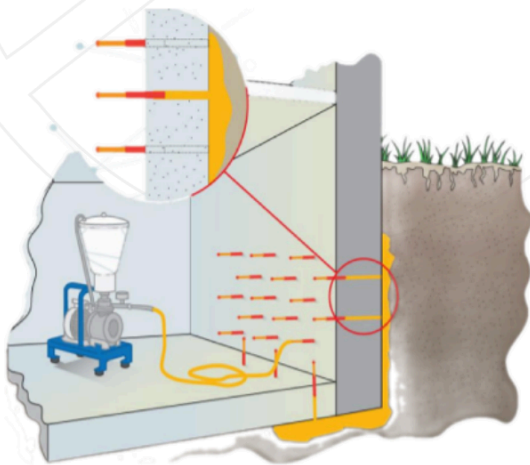

Performs in all climate zones I–IV

UV resistant

POLYURETHANE INJECTION WATERPROOFING ZEPTAFLEX® (FOAMS & RESINS)

Used to seal or fill dry and wet cracks, rehabilitate underground structures, fill cracks and internal voids in foundations, waterproof structures and stop heavy water inflows.

High elasticity,
no embrittlement

Versatile and
easy to use

Ready to use

High penetrating
ability

Adjustable
reaction time

Does not thicken
during storage

ACRYLATE GEL ZEPTAFLEX®

A material with excellent penetrating ability. Once cured, it forms a structured hydrogel mass that keeps its continuity under structural deformation and regenerates when re-wetted. The cured material holds its shape well.

Applications

- Waterproofing and restoring the watertightness of concrete structures and facilities
- Creating anti-filtration injection curtains behind structures
- Sealing wet and water-saturated cracks, expansion and cold joints, and seams in concrete structures
- Injection of areas with high humidity and standing water
- Waterproofing the bottom and walls of wells and tanks

Low viscosity ensures good penetration of the material

Adjustable pot life and curing speed

Cured material is highly resistant to acidic and alkaline solutions

ECO

High environmental performance
